```
[ ]: ### How to Extract Legal Citations using Python (for the complete beginner)  
### Law and Courts Newsletter  
### Rachael K. Hinkle  
### June 6, 2022  
### Run on macOS 10.15.7  
  
### The only difference in this code for Windows is the way filepaths are set up.  
↳ They use a different file separator.  
## Macs use a single forward slash; if you are using a mac run the following code:  
fileSeparator = "/"  
## Windows uses a double back slash: if you are using Windows use the following  
↳ code,  
# Note, to do this delete the "#" at the beginning of the next line.  
fileSeparator = "\\"
```

```
[ ]: # The following code turns off the autosave feature to avoid inadvertently  
↳ saving over a previous file.  
# As always, remember to save your work as you go along.  
%autosave 0
```

```
[ ]: ## Preliminary Step 1: It helps to verify we are running Python 3.6 before  
↳ proceeding  
  
# Python tip: Any text preceded by a "#" is ignored by Python.  
  
import sys  
print(sys.version)
```

```
[ ]: ## Preliminary Step 2: Install the lexNLP package (only need to do this the  
↳ first time)  
# Note: This step will take a bit of time. When an asterisk appears in the  
↳ square brackets  
# to the left of a cell (e.g. "In [*]"), that means the code is running. A  
↳ number will  
# appear in the square brackets when the code is done running.
```

```
[ ]: pip install lexnlp
```

```
[ ]:
```

```
[ ]: ## Preliminary Step 3: Import the libraries you will need for this session
    ↳(analogous to R packages)

    # 'os' provides useful funtions for dealing with the operating system
    # 're' provides the ability to use regular expressions
    # 'csv' provides the ability to write the results to a .csv file
    # 'string' provides useful functions for processing the opinion content
    # 'lexnlp' provides the ability to extract citations from natural language

    import os, re, csv, string, lexnlp
    import lexnlp.extract.en.citations
```

```
[ ]:
```

```
[ ]: ## Preliminary Step 4: See the name of your working directory
    os.getcwd()
```

```
[ ]: ## Preliminary Step 5: Setup a shortcut reference to your working directory

    # Python tip: This just creates a variable with a string.
    #           You can name the variable anything you want.

    mydir = os.getcwd() + fileSeperator
```

```
[ ]:
```

```
[ ]: ### Illustration 1: How to extract citations from a single file
    ## Note: If you are familiar with Python, you can proceed to Illustration 2
```

```
[ ]: ## Step 1.1: Read in an opinion (or other legal document) in a .txt file
    # This code creates a list; each entry of the list is a string that contains the
    ↳text
    # from one line in the file

    # Python tip: The "print()" function is very useful for seeing the contents of
    ↳variable
    #           to see or double check what the code is doing

    # Note: If you get an error, check that the "mydir" variable correctly lists
    ↳your directory
    # where the file is located, and/or make sure you have downloaded the "myExample.
    ↳txt" file from Dataverse.

    tfile = open(mydir + "myExample.txt", "r", encoding="latin-1")
```

```
lines = tfile.readlines()
print(lines)
```

[]:

```
[ ]: ## Step 1.2: Process the list from the previous step to create a single string
      ↳variable with
      # only the majority opinion content

      #create an empty string variable (that we will later fill with the majority
      ↳opinion)
      opinText = ""

      #create a logical operator variable (think of this as a switch set to "off")
      opin = False

      # loop through each line in the document in turn, after each line it goes to the
      ↳next,
      # when there are no longer any lines left, the loop will stop
      for line in lines:
          # Check to see if the line starts with some or no white space followed by
          ↳"OPINION" and then the end of the line
          # If so, turn the switch "on" (by making the logical operator variable equal
          ↳True)
          # Once this switch is turned on, it will remain that way until we turn it off
          if re.search("^[\s]*OPINION$", line):
              opin = True

          # Check for various strings that would indicate the end of the majority
          ↳opinion
          # If any of these patterns of text are found, turn the switch "off" by making
          ↳the logical operator variable equal False
          if line and (re.search("^[\s]*DISSENT", line)):
              opin = False
          if line and (re.search("^[\s]*CONCUR", line)):
              opin = False
          if line and (re.search("^[^A-Za-z]*APPENDI", line)):
              opin = False

          # For any line of text that occurs while the switch is "on", that is not
          ↳empty, add it
          # to the string variable where we are collecting the majority opinion text.
          if opin and not re.search("^[^\s]*$", line):
              opinText = opinText + line

      # Now that the loop is complete, and we have the entire opinion, we can process it
```

```

# This code finds any instances of one or more spaces and substitutes a single
↳space
opinText = re.sub("\s+", " ", opinText)

#Finally, we want to see our final product
print(opinText)

# Python tip: some elements of regular expressions used in the code above:
# ^: beginning of the line
# $: end of the line
# [\s]*: zero or more white spaces
# [\s]+: one or more white spaces
# [^A-Za-z]: Anything that is NOT a capital or lower case letter.
# (Inside the square brackets "^" means NOT, outside the brackets it means
↳beginning of the line)
# [A-Z] means any capital letter
# [a-z] means any lower case letter
# [A-z] means any letter
# [0-9] means any numeral

```

[]:

```

[ ]: ## Step 1.3: Extract citations from the opinion

#Extract each citation and put it in a variable
cite_holder = lexnlp.extract.en.citations.get_citations(opinText)

# See the citations extracted by using a loop
# Note: It doesn't work to just print the variable, but you can print (or
↳otherwise access)
#     each item in it by using a loop.
for cite in cite_holder:
    print(cite)

# From the output we can see that each citation has multiple pieces of
↳information
# Illustration 2 will show how to get key information into a spreadsheet for
↳further analysis

```

[]:

```

[ ]: ### Illustration 2: How to extract citations from all files in a subfolder
###         and output the data to a spreadsheet with one row per citation

```

```

[ ]: ## Step 2.1: Create and open a .csv file that we will write information into
fout = open(mydir + "myNewSpreadsheet.csv", "w", newline="")
outfilehandle = csv.writer(fout,

```

```
delimiter=",",  
quotechar="'',  
quoting=csv.QUOTE_NONNUMERIC)
```

```
# Create a row that contains the variables names and write that to the first row  
↳ of the .csv file  
localrow = []  
localrow.append("filename")  
localrow.append("volume")  
localrow.append("reporter")  
localrow.append("page1")  
localrow.append("page2")  
localrow.append("court")  
localrow.append("year")  
localrow.append("raw citation")

#localrow.append("numIds")  
outfilehandle.writerow(localrow)  
  
print(localrow)
```

```
#create a filepath to the folder where all text files are located  
dirname = mydir + "sampleOpinions" + fileSeperator  
# Create a list of all files in a given folder  
dirlist = os.listdir(dirname)  
# See the list of all files to make sure things are working  
print(dirlist)
```

[]: *## Step 2.3: Loop through all documents, process text, extract citations, process*
↳ citations,

```
## and export to spreadsheet
```

```
for entry in dirlist: ## each entry is a separate txt file with a single opinion  
    infilehandle = open(dirname + entry, encoding='latin-1')  
    txtlines = infilehandle.readlines()  
  
    # This is useful for watching the progress of the code, especially with many  
↳ documents  
    print(entry)  
  
    # Create empty variables (each time through the loop it is important to make  
↳ sure  
    # all variables are empty so values from the previous document do not carry  
↳ over)
```

```

opin_string = ""
#opin_string2 = ""
#opin_string3 = ""
#opin_string4 = ""
sent_holder = []
cite_holder = []
localrow = []
sct = 0
op_line = False

# Loop through each line in the document
for txtline in txtlines:

    # Find the beginning and end of the opinion
    if re.search("[^A-Za-z]*OPINION[\s]*$", txtline):
        op_line = True
    if line and (re.search("[\s]*DISSENT", line)):
        opin = False
    if line and (re.search("[\s]*CONCUR", line)):
        opin = False
    if line and (re.search("[^A-Za-z]*APPENDI", line)):
        opin = False

    # Create a string with the majority opinion and process the text
    if op_line:
        opin_string = opin_string + txtline

    ## After looping through all lines in the document, do the following steps
    ↪once per document

    ## Process text in opinion string

    # Get rid of newline characters
    opin_string = re.sub("\n", " ", opin_string)
    # Replace short citations with the placeholder "999 U.S. 999" that will be
    ↪recognized by lexnlp
    opin_string = re.sub("[\s](I|i)d\.[\s]", " 999 U.S. 999 ", opin_string)
    opin_string = re.sub("[\s](I|i)bid\.[\s]", " 999 U.S. 999 ", opin_string)

    # Extract citations
    cite_holder = lexnlp.extract.en.citations.get_citations(opin_string)

    # Change "cite_holder" to a list object
    cite_holder = list(cite_holder)

    # Create a second variable that replaces short references with the full
    ↪citation

```

```

    #Python tip: Python indexes begin with zero. So to extract the first element
    ↪of the
    #           variable "cite_holder", we can use "cite_holder[0]"

    cite_holder2 = []
    # Since we need to refer back to the previous element of the loop for this
    ↪task,
    # we use a different kind of loop that uses an index, "i"
    for i in range(0, len(cite_holder)):
        if cite_holder[i][0] == 999: #and cite[1] == "U\.S\." and cite[3] == 999:
            cite_holder2.append(cite_holder2[i-1])
        else:
